

Clark

2027 FUTURE VEHICLE CONCEPT

PROJECT DYNAMO

**Seven specialized vehicles. One electric-drive
platform. Two energy strategies.**

AN INDEPENDENT COGNISINT DESIGN AND PRODUCT-STRATEGY STUDY

THE PROPOSITION

SPECIALIZATION WITHOUT FRAGMENTATION.

Everything does not need to become the same crossover. Dynamo offers a sedan, hatch, wagon, crossover, SUV, CityVan, and pickup while concentrating complexity in shared electric drive units, controls, battery structure, software, service procedures, mirrors, switchgear, latches, seat hardware, and a partially recessed fixed-grip door-handle cartridge. The individual vehicle needs to be competitive; the platform creates the larger advantage by spreading investment and policy risk across seven bodies and two energy strategies.

THE DESIGN ANCHORS

DYNAMO SEDAN

Quiet confidence.

DYNAMO ESTATE

Useful elegance.

HIGH-PROFILE FLAGSHIP

TOURING.

A genuinely taller body, higher sightline, greater clearance, and an upright American greenhouse. Three-row utility without losing the family's restrained surfaces and electric-first proportions.

A NEW CATEGORY

CITYVAN UTILITY. CONSTELLATION HOSPITALITY.

More upright and space-efficient than a conventional minivan; more refined, passenger-friendly, and garageable than a full commercial delivery van. A worthy successor to the Clark Constellation.

The image shows the interior of a car, likely a concept vehicle, with a focus on the driver's side. The seats are upholstered in a light brown leather with a textured pattern. The dashboard is low and horizontal, featuring a large, clear instrument cluster and a central infotainment screen. The center console has a gear shifter and handbrake. The overall design is minimalist and modern, with a focus on comfort and functionality. The background shows a city skyline at night through the car's windows.

INSIDE DYNAMO

SIMPLE AND PLUSH.

A low horizontal dashboard. Clear instruments. Physical controls for frequent tasks. Warm textiles, broad cushioned surfaces, honest storage, and technology that knows when to disappear.

CONSTELLATION INTERIOR

TWO FIXED FRONT SEATS. TWO REMOVABLE CAPTAINS. ONE THREE-PLACE REAR BENCH.

Floor tracks let the second row slide, rotate, or leave the vehicle - without pretending occupied rows create impossible cargo space.

THE COMPLETE 2027 CONCEPT FAMILY

SEVEN BODIES. FAMILIAR BONES.

THE ENERGY MODULE CHANGES. THE PROPULSION SYSTEM DOES NOT.

PROJECT DYNAMO

PETRO-ELECTRIC

BATTERY ELECTRIC

ONE ELECTRIC DRIVETRAIN. TWO ENERGY STRATEGIES.

THE DIFFERENCE IS THE PATH TO THE WHEELS.

01 CONVENTIONAL ICE

Fuel > engine > transmission > wheels

Mature and light. Engine speed and road speed remain mechanically coupled.

02 CONVENTIONAL HYBRID

Fuel + battery > engine/motor/transmission > wheels

Efficient and proven, but retains an engine-to-wheel path while adding electric hardware.

03 DYNAMO PETRO-ELECTRIC

Fuel > Dynamo Module > electricity > motor > wheels

Only electric traction drives the wheels. Each fuel family requires a matched module and storage system.

04 BATTERY ELECTRIC

Grid > battery > motor > wheels

The simplest and lowest-maintenance propulsion system, bounded by stored energy and charging access.

STOP ASKING AN ICE PLATFORM TO PRETEND IT WAS BORN ELECTRIC.

MANUFACTURING

One body and assembly logic supports both energy strategies.

PARTS

Shared handles, visors, console parts, lamp modules, trim profiles, fascia hardware, wheel families, sensors, and diagnostics.

PACKAGING

Battery, module bay, cooling, crash structure, and cabin designed together.

PROPORTIONS

Long wheelbases, short overhangs, flat floors, and useful cabins.

ENERGY RECOVERY

Shared e-drives and blended brakes recover deceleration energy in every PE and BEV body.

VOLATILITY HEDGE

Policy reversals, fuel-price shocks, and charging delays change the PE/BEV factory mix - not the entire vehicle program.

PLAUSIBLE ENOUGH TO INTERROGATE. NOT PRECISE ENOUGH TO PRETEND.

Model	L x W	Weight PE / BEV	Torque	Battery PE / BEV	Gen.	PE mpg	0-60	Top / cruise
Sedan	181.8 x 72.2	3,590 / 3,670 lb	295 lb-ft	32 / 72 kWh	80 kW	39	6.1 s	118 / 75
Fastback	179.5 x 72.4	3,630 / 3,710 lb	295 lb-ft	32 / 72 kWh	80 kW	38	6.2 s	116 / 75
Estate	186.2 x 72.6	3,790 / 3,860 lb	315 lb-ft	36 / 78 kWh	85 kW	37	6.4 s	115 / 75
Utility	178.8 x 73.4	3,880 / 3,940 lb	335 lb-ft	38 / 78 kWh	90 kW	35	6.2 s	112 / 75
Touring SUV	194.0 x 77.4	4,740 / 4,860 lb	500 lb-ft	45 / 105 kWh	120 kW	28	5.8 s	112 / 70
Constellation	196.5 x 76.5	4,480 / 4,560 lb	360 lb-ft	42 / 95 kWh	105 kW	31	7.1 s	105 / 70
Pickup	200.5 x 76.8	4,650 / 4,760 lb	500 lb-ft	45 / 100 kWh	120 kW	27	5.9 s	110 / 70

PE / BEV values shown in that order. Fuel economy models a gasoline-electric module. Generator-running mpg, acceleration, top speed, sustained level-road cruise, mass, and dimensions are concept targets - not tested or certified claims.

COMPETITIVE ACROSS THE WHOLE USE CASE.

Architecture	Weight	Energy	Battery	Torque	0-60	Annual energy	75k-mi maint.	Strongest case
Efficient ICE	2,875 lb	36 mpg	-	~133 lb-ft	~8.5 s	\$1,167	\$7,575	Low mass, mature infrastructure
Mechanical hybrid	3,208 lb	49 mpg	~1-2 kWh	~232 lb-ft	~6.2 s	\$857	\$7,050	Best gasoline-only efficiency
Dynamo PE target	3,590 lb	39 mpg gen.	32 kWh	295 lb-ft	6.1 s	\$759	\$6,000	105-mi electric target + rapid refueling
Dynamo BEV target	3,670 lb	28 kWh/100mi	72 kWh	295 lb-ft	5.9 s	\$571	\$4,575	Lowest energy and maintenance burden

WHERE PE GIVES GROUND

A mechanical hybrid can beat series generation on sustained gasoline highway mpg because it avoids converting mechanical energy to electricity and back.

WHERE BEV LEADS

The full-electric version is simpler, more efficient, and cheaper to maintain because it carries no engine, fuel, exhaust, or emissions hardware.

WHERE PE IS COMPETITIVE

At these energy prices, PE beats the 49-mpg hybrid's annual energy cost above roughly 48% plugged-in electric miles.

THE VEHICLE MUST BE COMPETITIVE. THE PLATFORM CREATES THE LARGER ADVANTAGE.

WHAT STILL HAS TO BE PROVED.

- PE remains more complex and maintenance-intensive than BEV.

- Generator, fuel, exhaust, cooling, and battery can erase mass savings.

- Sustained towing and grades depend on generator output and thermal capacity.

- Occasional engine use creates fuel-aging, catalyst, noise, and emissions challenges.

- A modular bay is not a literal one-for-one volume swap.

- Cost, durability, repairability, certification, and real efficiency require validation.

BOTH HALVES HAVE EXISTED - JUST NOT TOGETHER.

2019: ELECTRIC-ONLY WHEEL DRIVE

Ford's Transit Custom and Tourneo Custom PHEVs drove their front wheels exclusively with an electric motor. A 1.0-liter gasoline engine acted solely as a range extender, with no physical connection to the wheels. The architecture stayed within the Transit Custom family.

2025: ELECTRIC-FIRST PLATFORM

Ford's announced Universal EV Platform applies ground-up electric architecture and new assembly logic to a family of affordable vehicles, beginning with a roughly \$30,000 midsize four-door electric pickup targeted for 2027.

PROJECT DYNAMO IS THE 'YES, AND.'

Combine the Transit's electric-only wheel drive with the new platform's ground-up simplicity, then extend that logic across a complete vehicle family.

Clark

A LINEUP THAT MAKES THE COMPANY'S DIRECTION VISIBLE.

Independent concept study. Clark Motor Company is fictional and its red trapezoid logo is a stand-in. Ford Motor Company is named only as a factual precedent and point of comparison. This work was not commissioned, reviewed, sponsored, or endorsed by Ford or any other manufacturer.

All Clark dimensions, performance, costs, ranges, and efficiency figures are simulated design targets, not tested or certified claims. Vehicle and schematic imagery were produced with generative tools under human creative direction.
